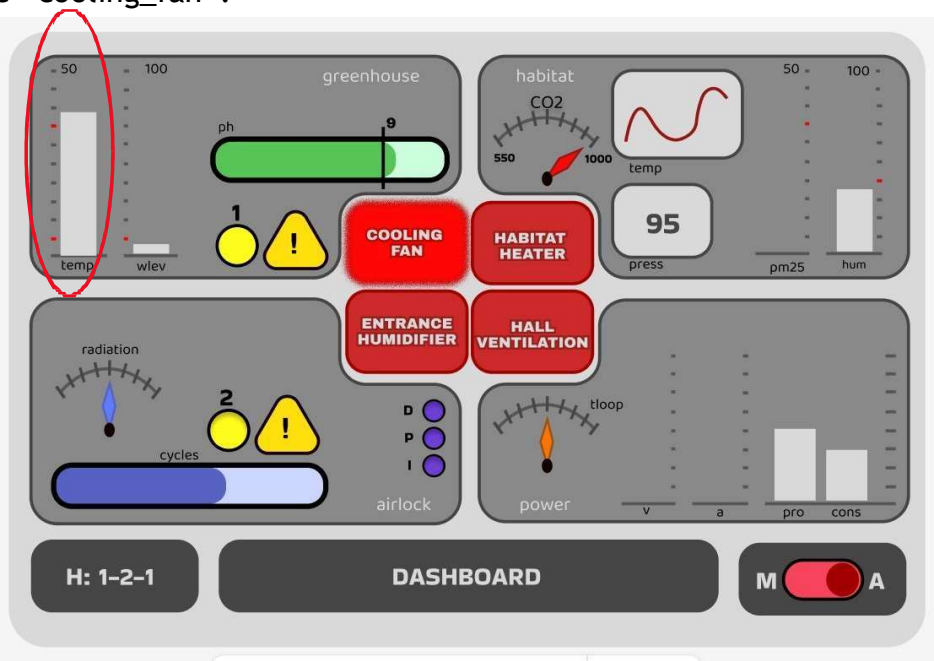
WELCOME TO MARS. PLEASE DON'T DIE.

The Figma representation of the User Stories

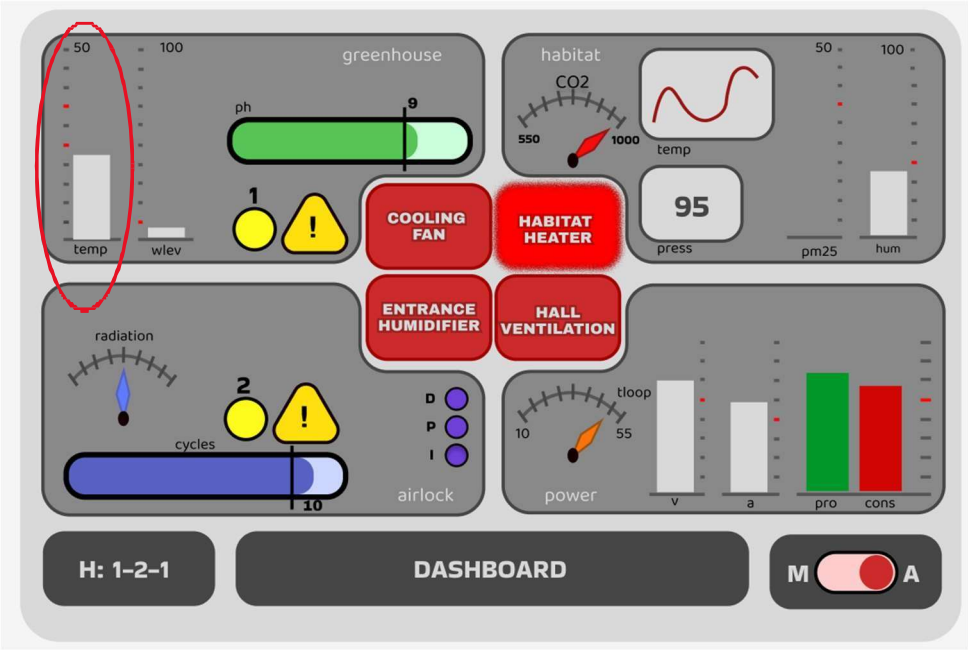
1. User Story #1

As a Botanist, if the `greenhouse_temperature` rises above 32 degrees, it automatically activates the `cooling_fan`.



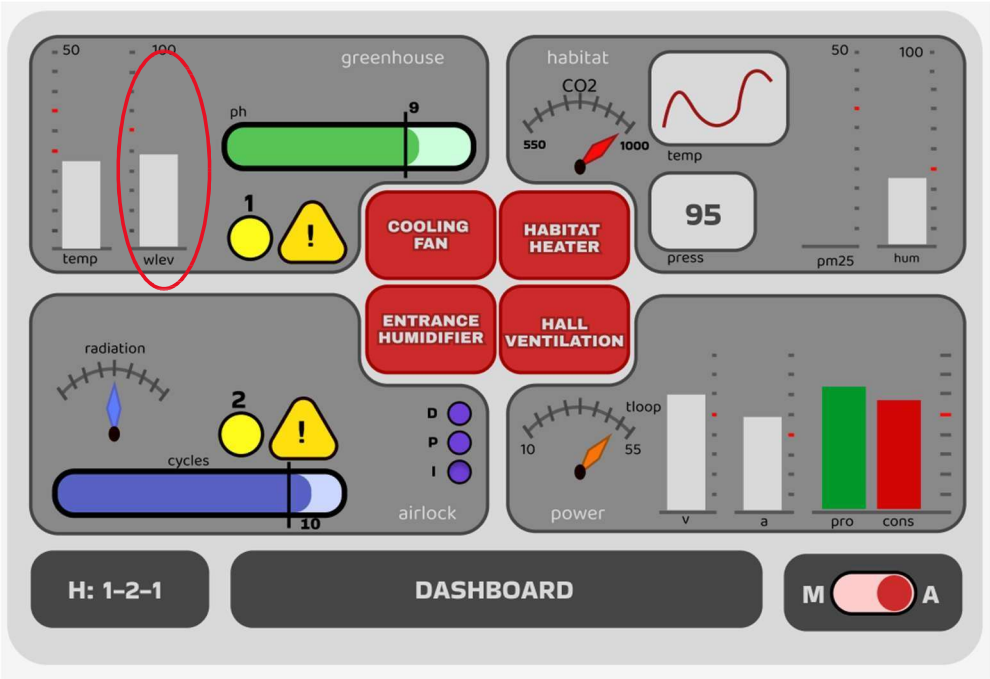
2. User Story #2

As a Botanist, if the `greenhouse_temperature` falls below 25 degrees, it automatically activates the `habitat_heater`.



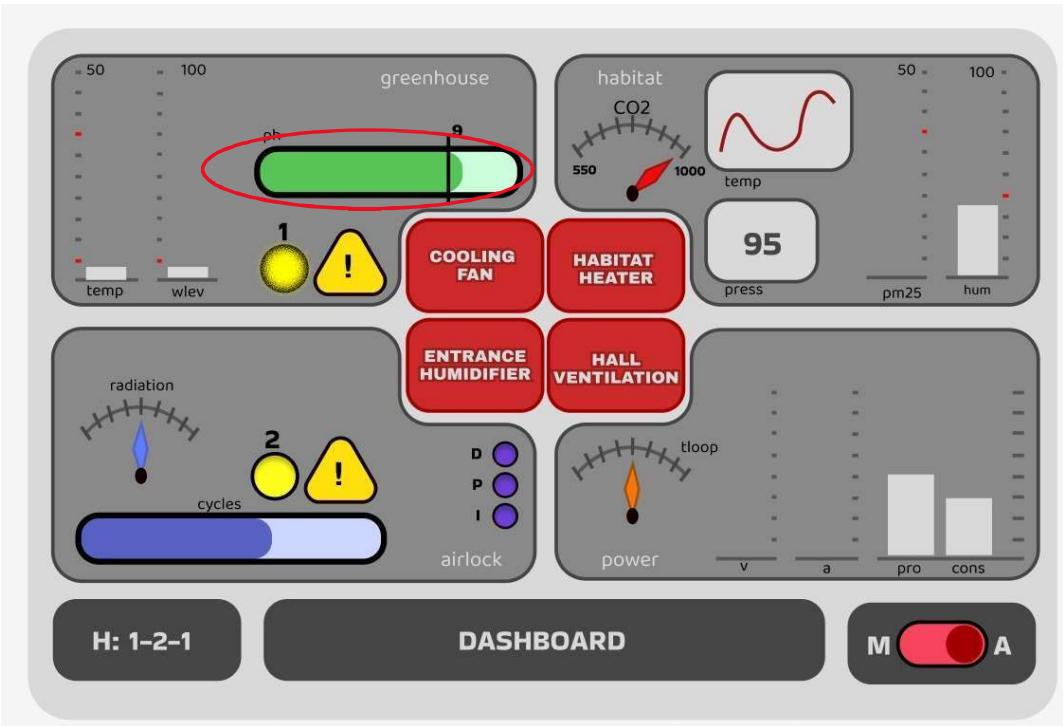
3. User Story #3

As a Botanist, if the `water_tank_level` falls below 60%, it automatically deactivates the `entrance_humidifier`.



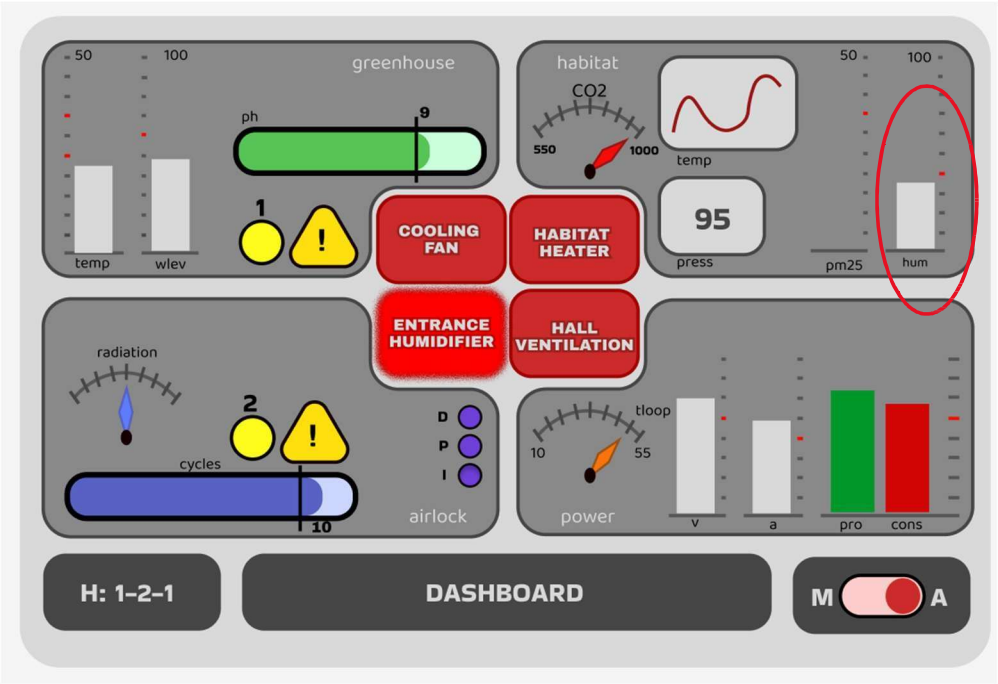
4. User Story #4

As a Botanist, if the `hydroponic_ph` rises above 9, a warning UI light is turned on to block nutrients.



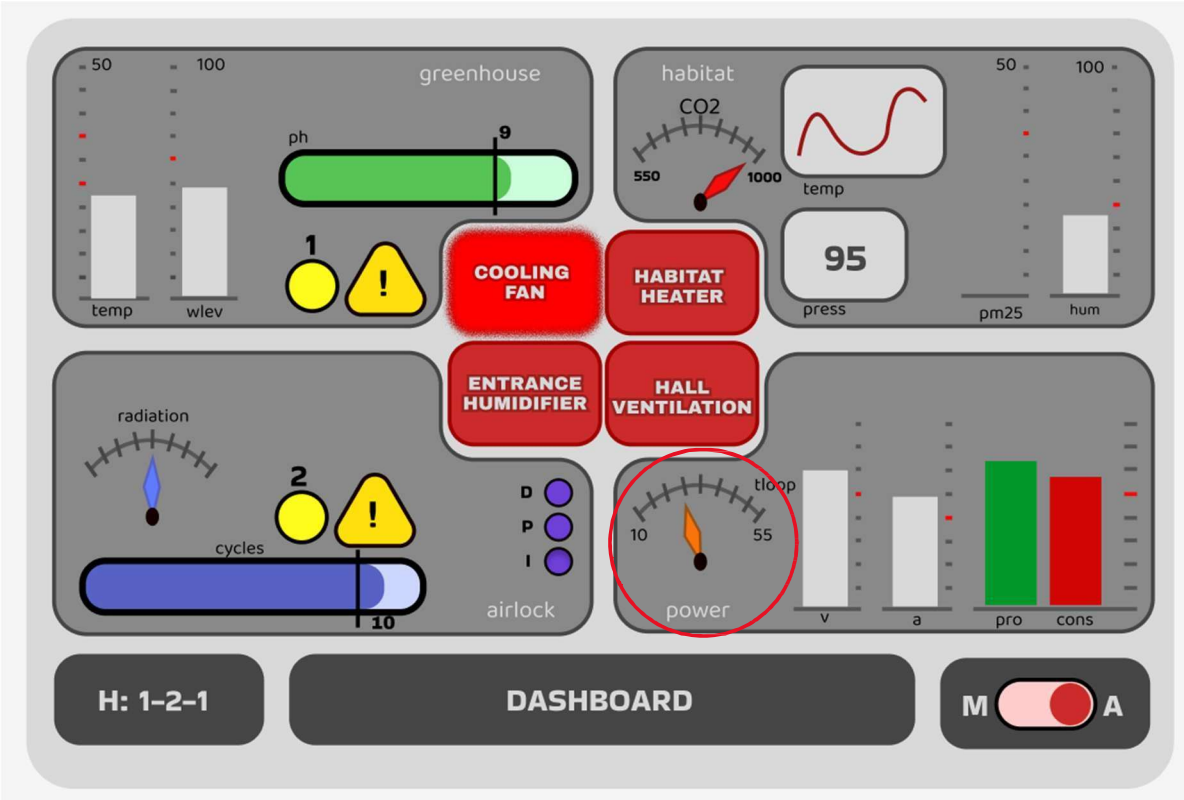
5. User Story #5

As a Safety Manager, if the `entrance_humidity` drops below 40%, it automatically activates the `entrance_humidifier`.



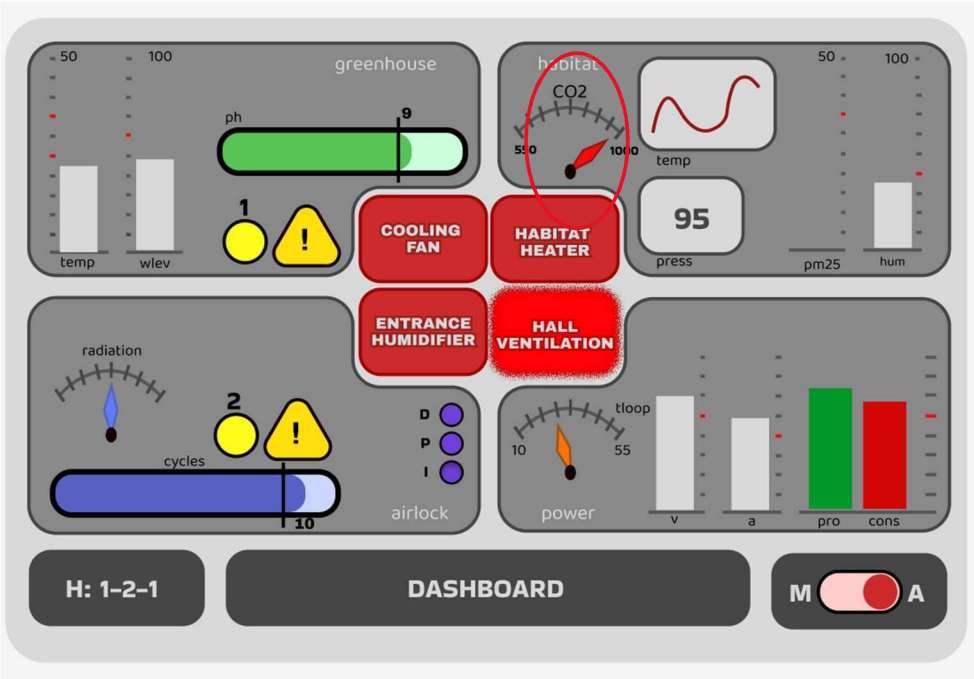
6. User Story #6

As a Safety Manager, if the `thermal_loop` exceeds 55 degrees, it automatically activates the `cooling_fan`.



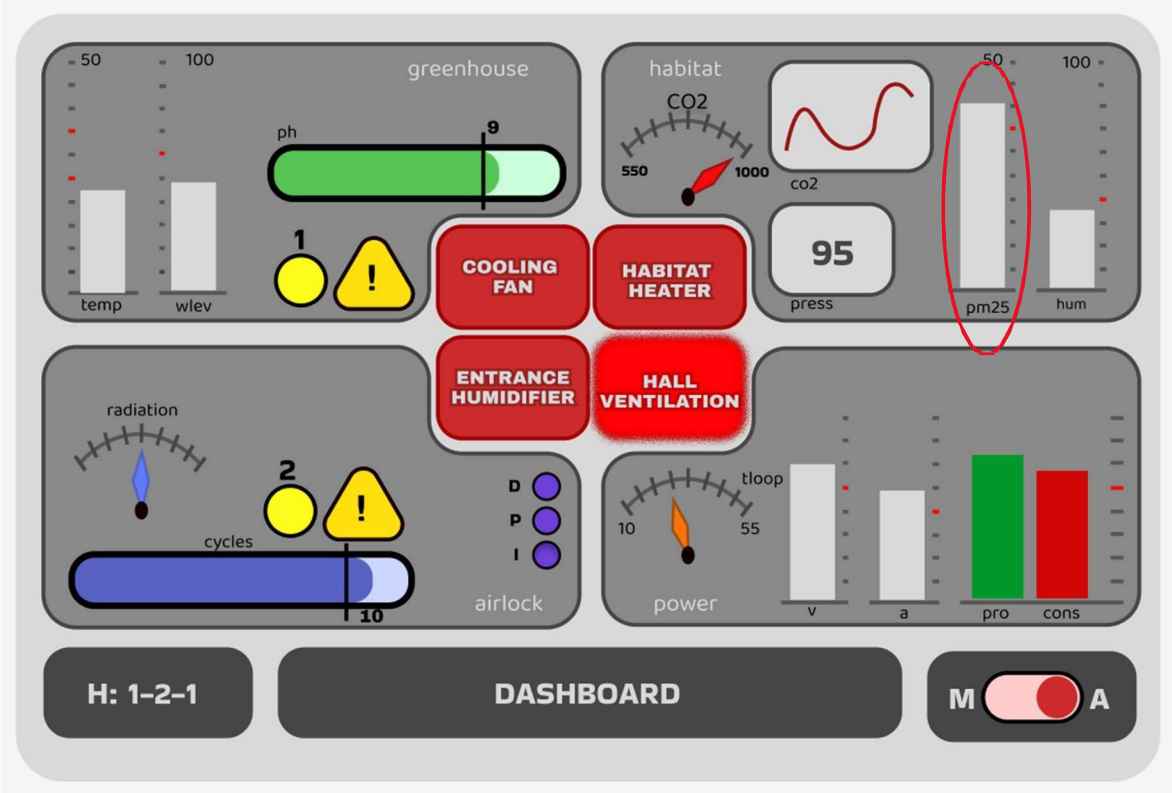
7. User Story #7

As a Safety Manager, if the `co2_hall` exceeds 950ppm, it automatically activates `hall_ventilation`.



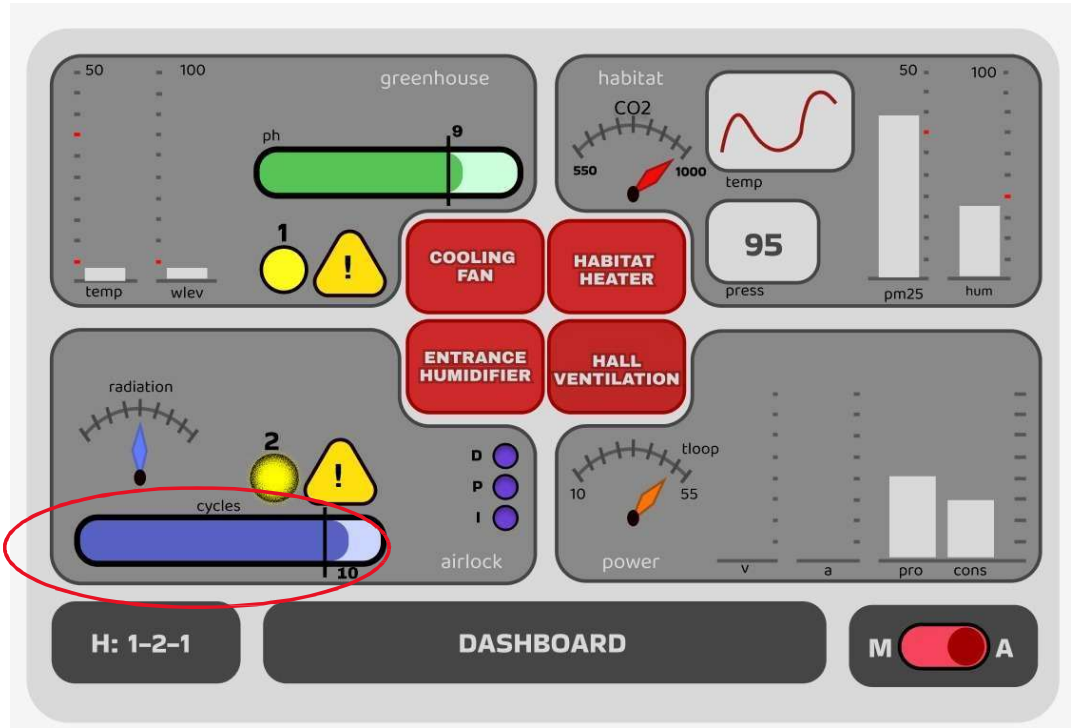
8. User Story #8

As a Safety Manager, if the `air_quality_pm25` exceeds 35, it automatically activates `hall_ventilation`



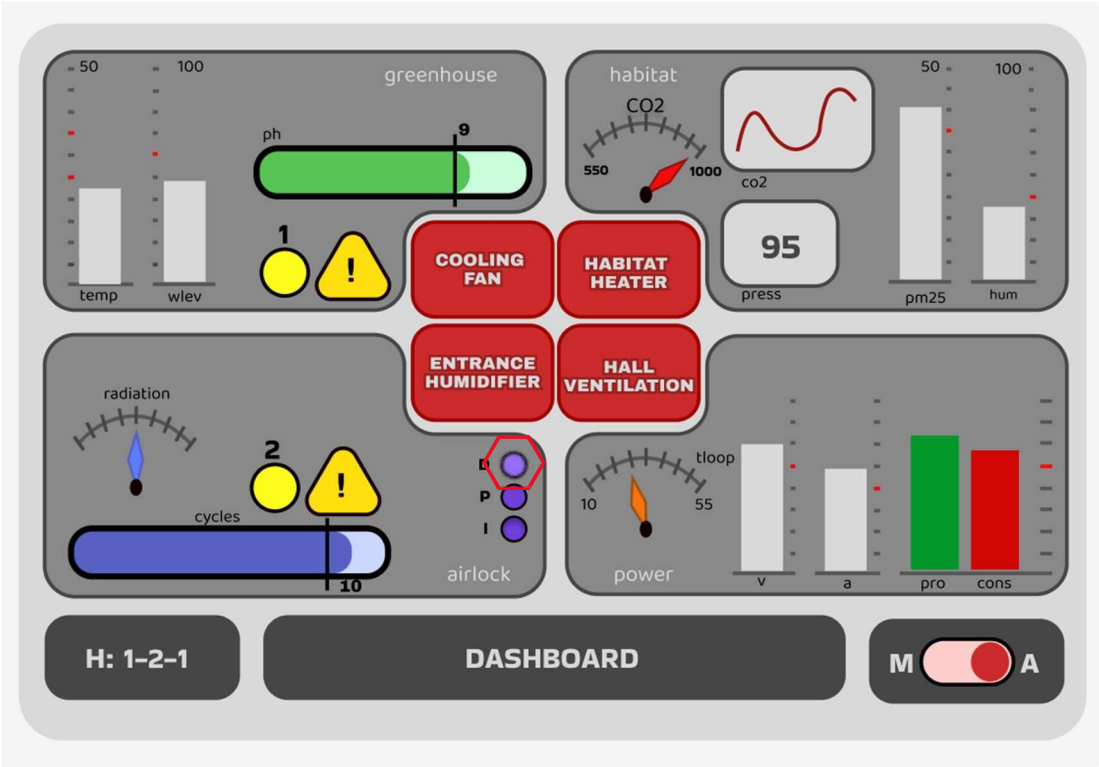
9. User Story #9

As a Safety Manager, if the `airlock` cycles exceed 10 in the same hour, a warning UI light is turned on.



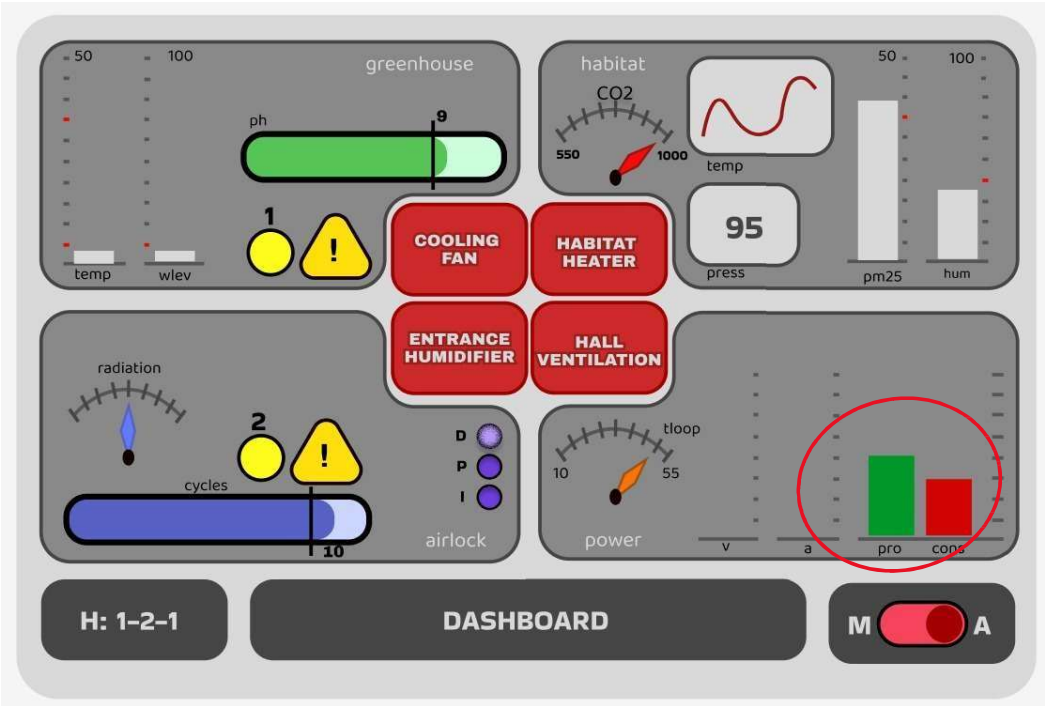
10. User Story #10

As a Safety Manager, if the `airlock` is in DEPRESSURIZING status, it automatically disables `hall_ventilation`



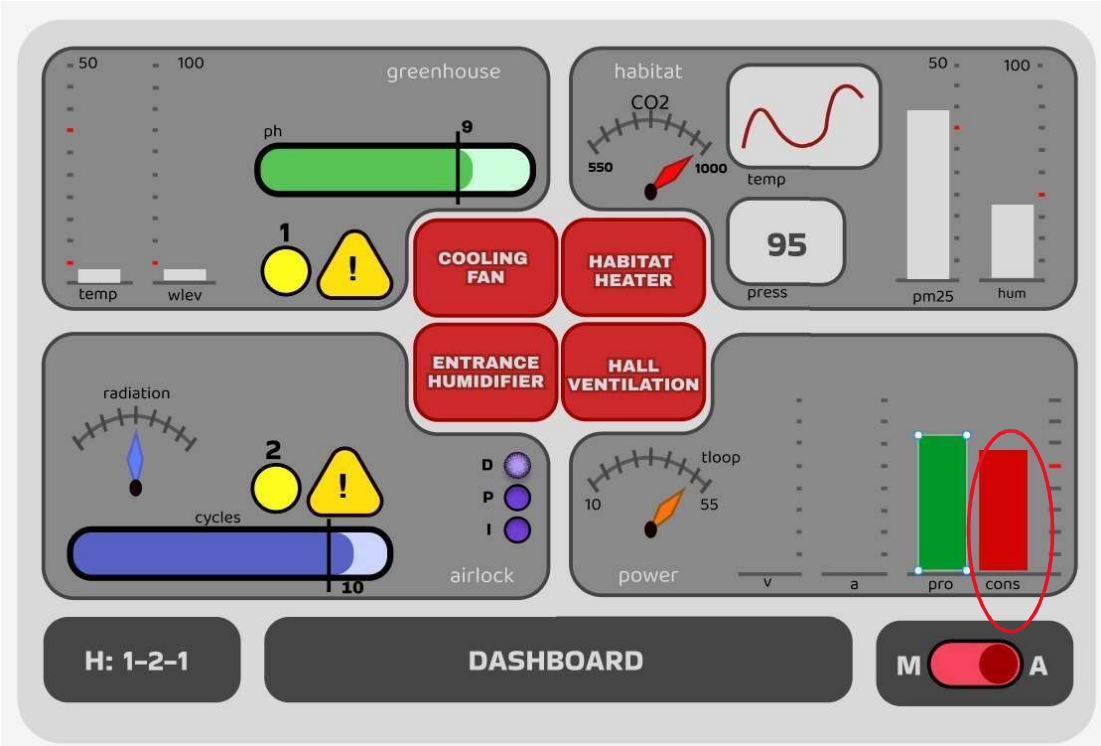
11. User Story #11

As an Energy Engineer, I want to compare the power produced by the `solar_array` panels with the power consumed `power_consumption` to check that the one produced is never lower.



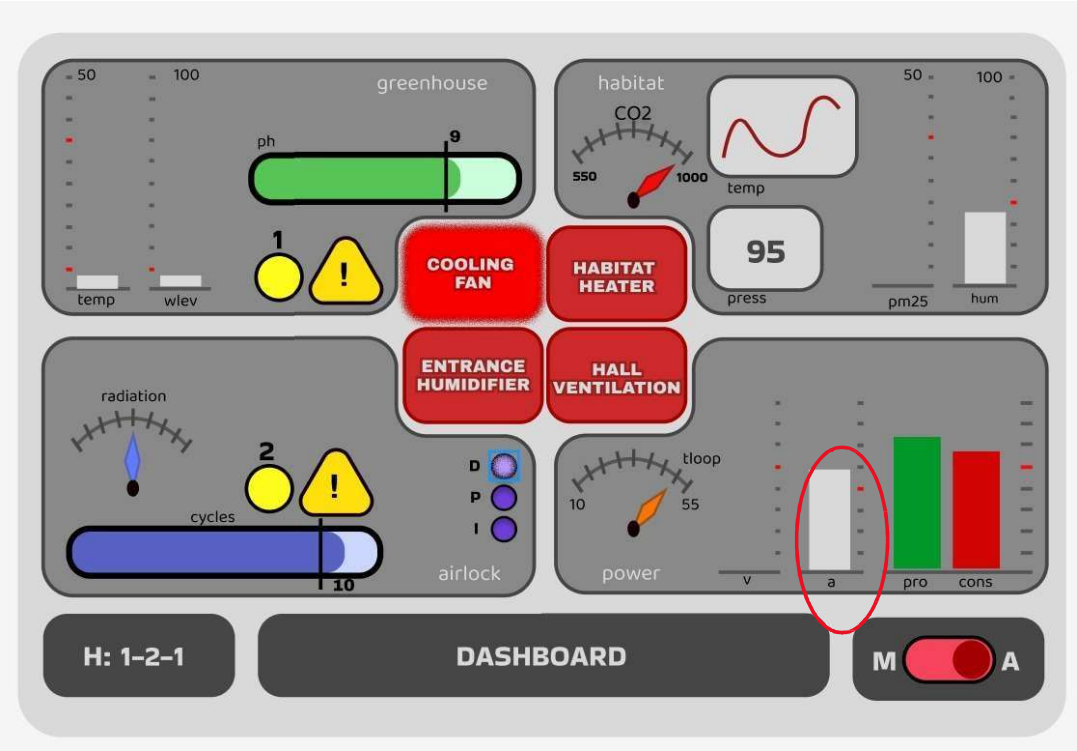
12. User Story #12

As an Energy Engineer, if the `power_consumption` exceeds 50 KW, it automatically deactivates `habitat_heater`.



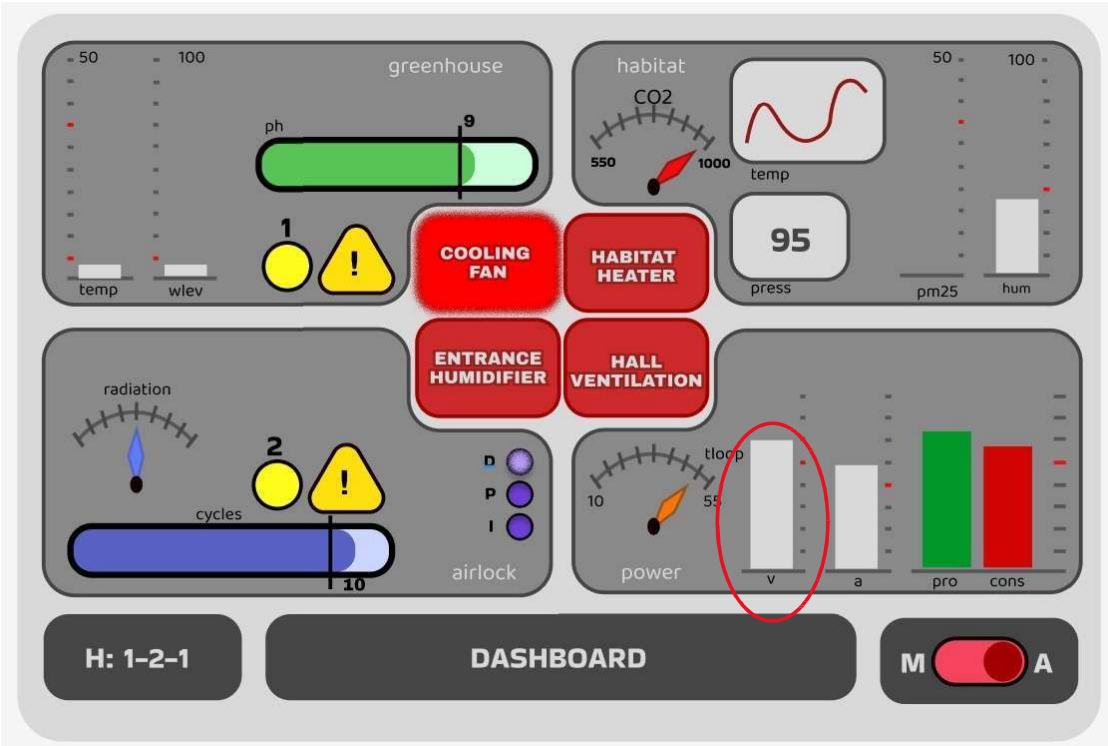
13. User Story #13

As an Energy Engineer, if the current of the `power_bus` exceeds 220A, it automatically activates `cooling_fan`.



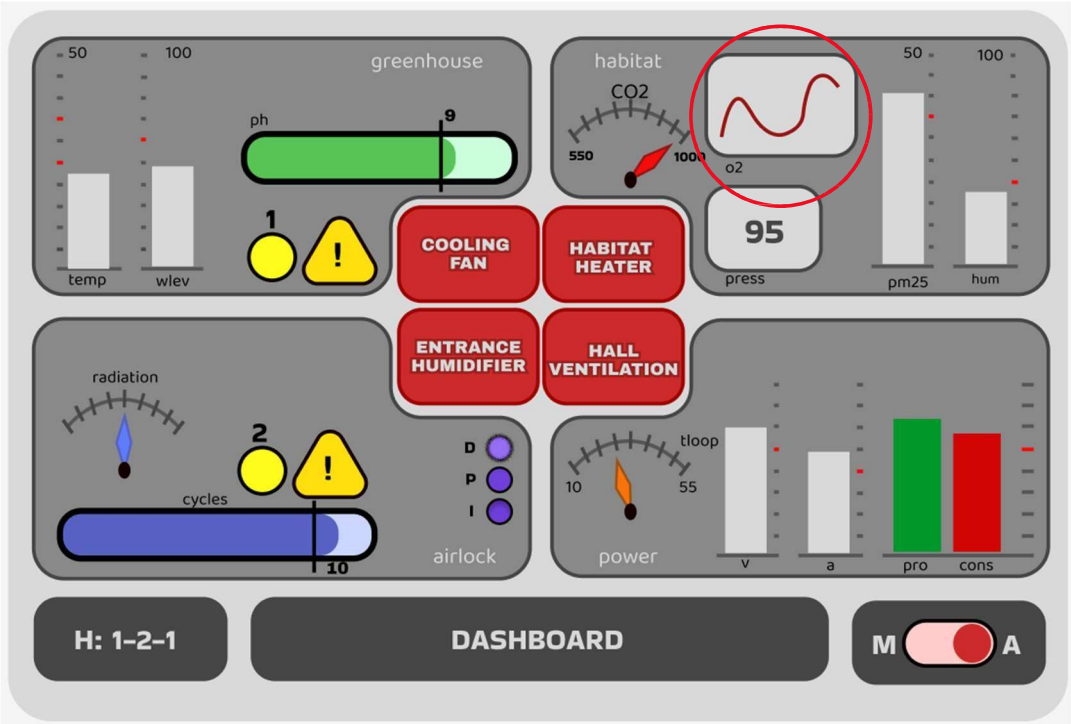
14. User Story #14

As an Energy Engineer, if the voltage of the `power_bus` exceeds 250V, it automatically activates `cooling_fan`.



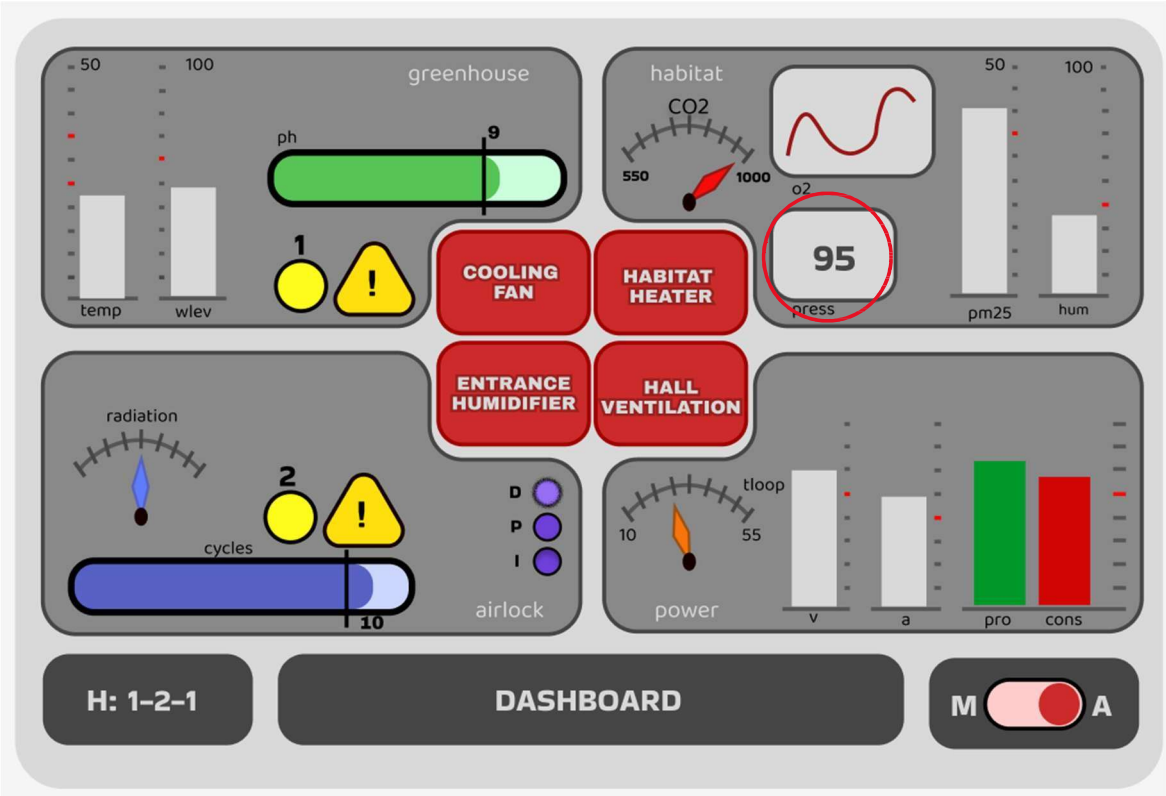
15. User Story #15

As an Administrator, I want to graphically view the habitat oxygen to keep track of the trends.



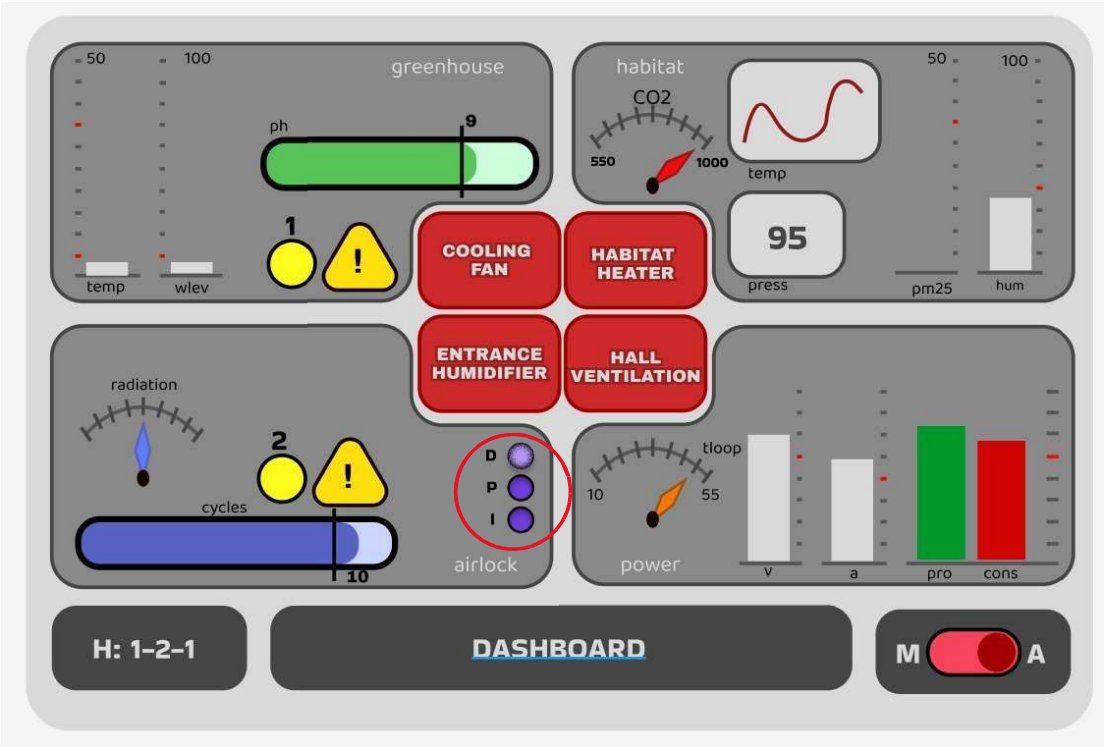
16. User Story #16

As an Administrator, I want to monitor the `corridor_pressure` to possibly provide emergency suits.



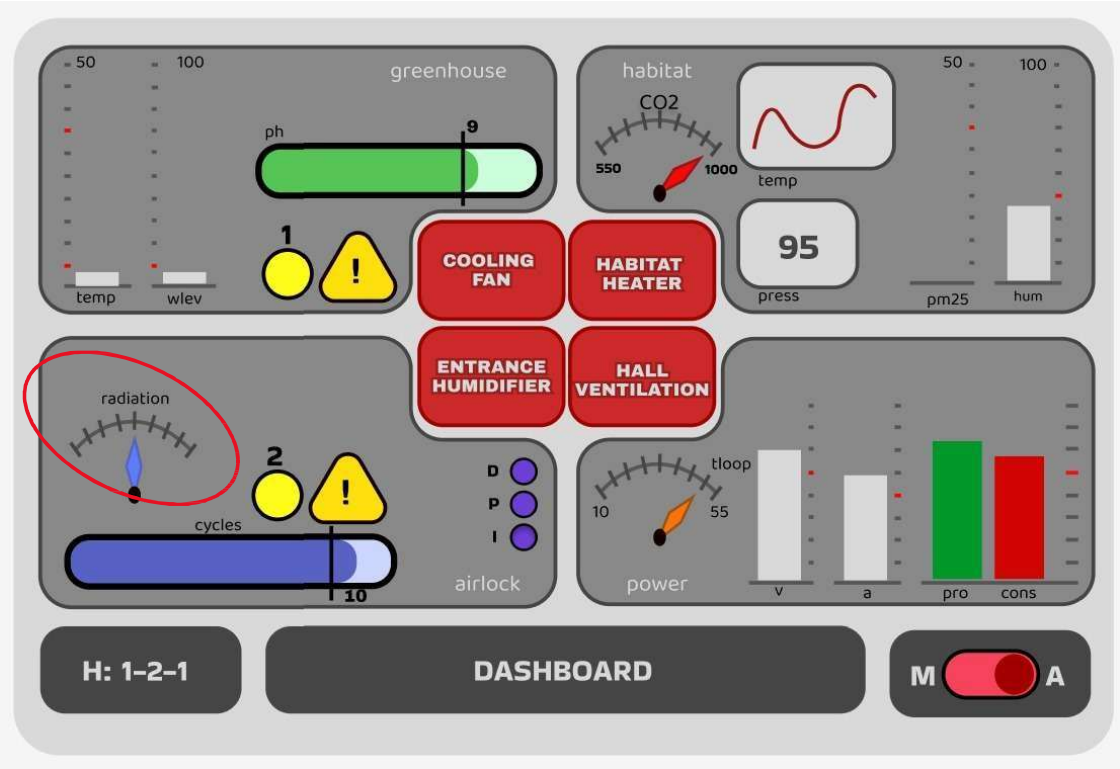
17. User Story #17

As an Administrator, I want to view the status of the `airlock` to coordinate activities safely.



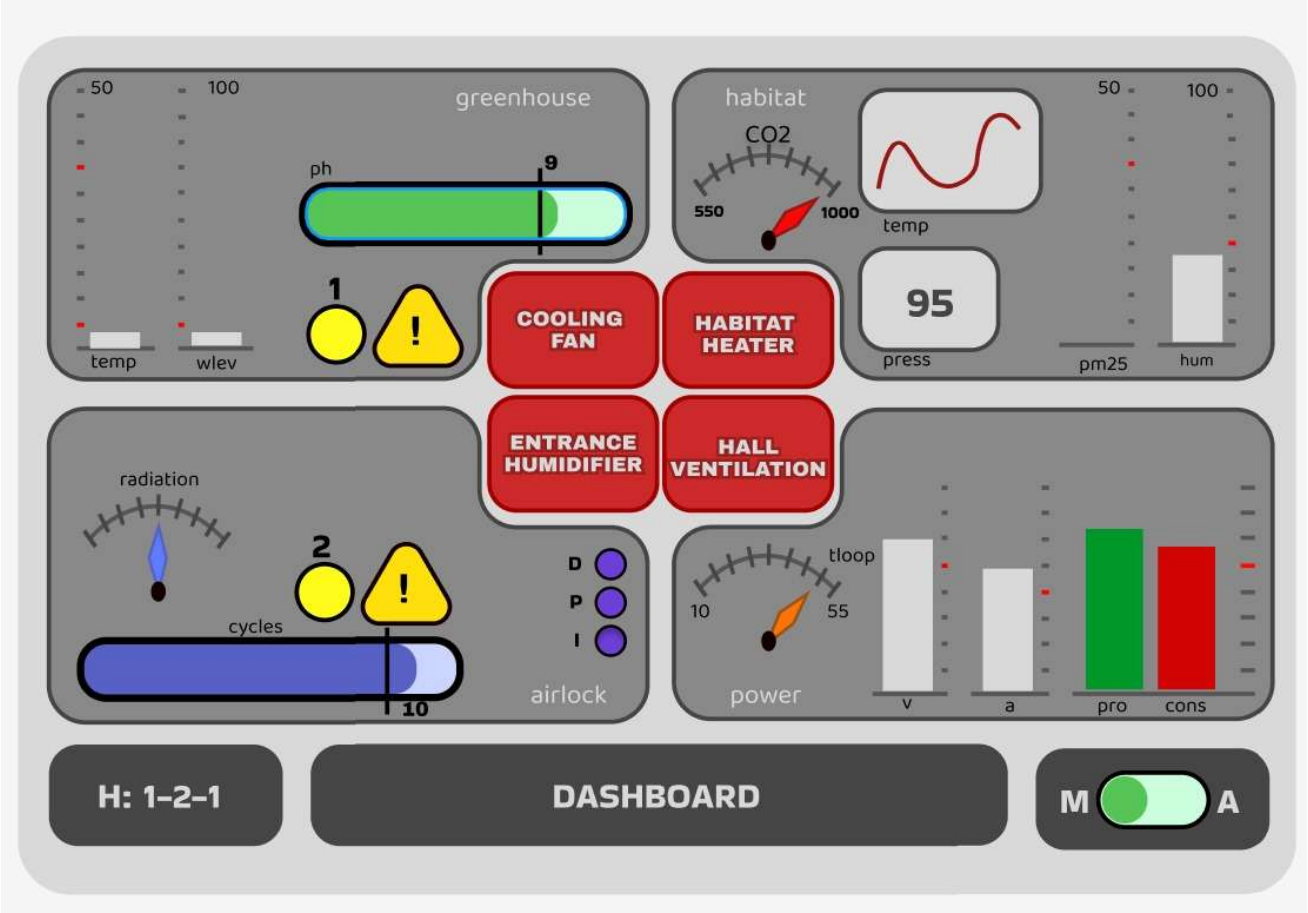
18. User Story #18

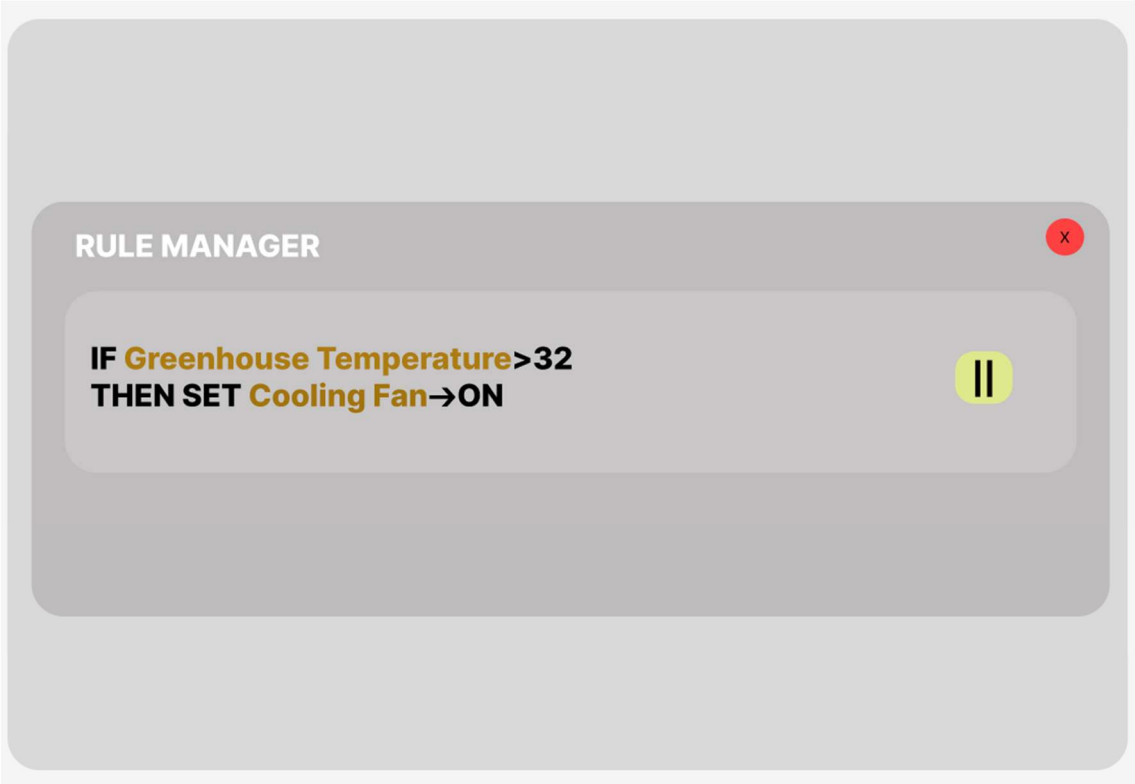
As an Administrator, I want to monitor `radiation` levels to allow the return of personnel who are outside.



19. User Story #19

As an Administrator, I want to be able to deactivate automation rules to take manual control.



20. User Story #20


As an Administrator, I want to be able to deactivate or activate any of the automation rules to take manual control over the paramaters.
